

Profile rail guides

The SKF Group

The SKF Group is an international industrial corporation of AB SKF Sweden, founded in 1907, operating in 130 countries. The company has some 45000 employees and more than 80 manufacturing facilities throughout the world. Its international network is supported up by nearly 20000 distributors and retailers. SKF is the world leader in the rolling bearing business. Bearings, seals and special steels are SKF's main product areas. In addition, they also manufacture and sell, other industrial precision components and products.

SKF Linear Motion

One of these industrial precision products assortment is manufactured and sold by the SKF Linear Motion Division. This unit has some 700 employees, 6 manufacturing facilities, 3 product lines. One of the division's strengths is its ability to serve the market through its organization based on 11 specialized Sales Companies located in Europe and North America; however product availability and product application support is provided world-wide by the SKF international network.

The Linear Motion product range covers:

- High Efficiency Screws
- Linear Guiding Systems
- Electromechanical Actuators

CD-ROM "Designer"

All linear Motion products are available in this CD, in DWG and DXF files. Thanks to "Designer", you can easily copy the drawing of the product you need into your own design drawing. If you are interested, please do not hesitate to contact your local SKF sales organization. It is free of charge.

Introduction

As the world leader in the production of rolling bearings, SKF supplies practically all kinds of rolling bearing for rotational and linear motion. SKF is therefore able to meet its customers' requirements both technically and economically. This catalogue covers the whole range of profile rail guides available from SKF. Profile rail guides from SKF are precision rolling bearings for linear motion systems and are therefore suitable for installation in a wide variety of machines. With the High Performance range of profile rail guides SKF is able to offer a linear guidance system with an optimum price/performance ratio for every application.

Profile rail guides are available from SKF in a wide choice of types and sizes and, because of their unlimited stroke, they are suitable for practically any linear motion installation. Their unitised design simplifies the making of any subsequent alterations to the equipment.

The catalogue includes all important data. For additional technical detail, please refer to the SKF Technical Handbook on linear bearing systems (4185 E) which provides information on application, selection, operational life, mounting and maintenance of profile rail guides. If further information is required, please contact your nearest SKF sales office.

This catalogue is based on current production. The right is reserved to make changes necessitated by technical developments of the products so that the benefits can be passed on to the user without delay. Earlier publications, the data in which deviate from those given here, are rendered invalid.

Product review

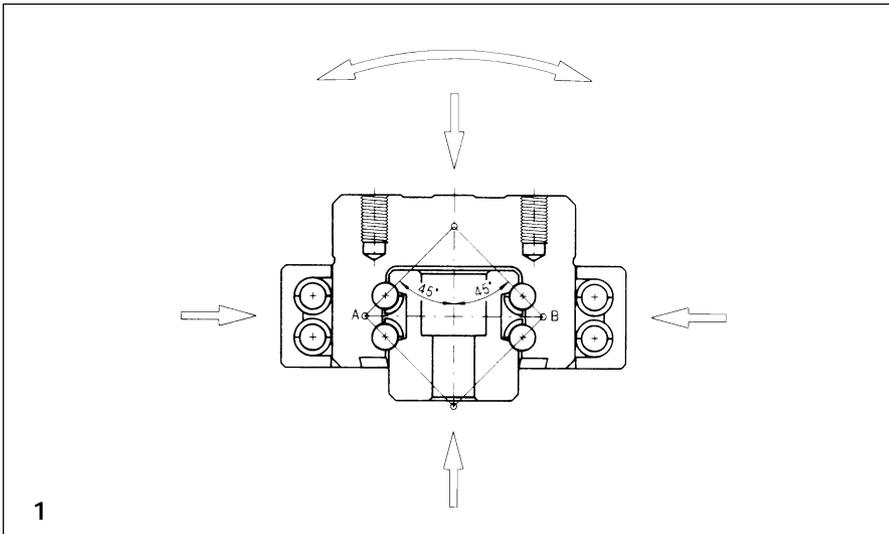

Profile rail guides from SKF are modern machine components used in the production of linear guidance systems with unlimited travel. They usually consist of a profile rail with four precision-ground raceways and a slide unit with four ball circulation paths. This design offers numerous benefits. The square configuration of the raceways results in a guidance system with good rigidity, capable of withstanding moment loads in all directions. The load carrying capacity is equal in all four directions (fig 1). Ready-to-mount units guarantee economy and simplicity of mounting. Installation and adjustment procedures are reduced

to a minimum. The design of the system is such that inaccuracies of the adjacent components can be accommodated. SKF profile rail guides are noted for their ease of maintenance and reliability. They are provided as standard with grease nipple and all-round seals. The two-point contact of the rolling elements with the raceways permit high operational speeds with quiet running and low coefficient of friction. Good running accuracy is assured throughout the operational life of the system. Guides with specific preload can be supplied for special requirements. This is achieved through selection. The

choice of preload is dependent on the load carrying and stiffness specifications.

To meet the widest possible range of customer demands, SKF offers seven different series of profile rail guides. Table 1 shows basic data for the various models.

Accuracy classes

Profile rail guides from SKF are available in five tolerance classes. These are defined in the adjacent table and are applicable to all kinds of profile rail guides excluding the miniature range.

Dimensional tolerance of height "H"

This refers to the maximum variation of the dimension "H" for a slide unit on a profile rail guide (table 1).

Dimensional tolerance of width "N"

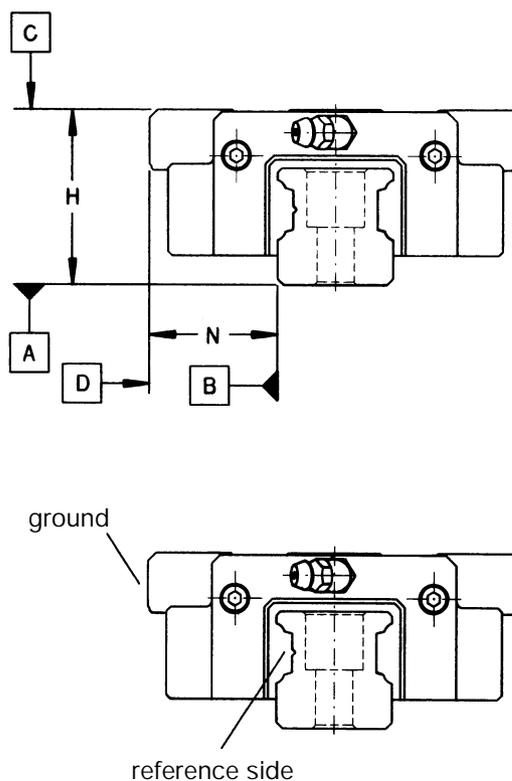

This refers to the maximum variation of the dimension "N" for a slide unit on a profile rail guide (table 1).

- Dimension "N" is defined as the distance between the ground datum face of the rail and the ground datum side of the slide unit. The datum side of the rail is marked with a groove.
- Tolerances listed here are average values measured at the middle point of the slide unit.
- Tolerances should be checked again after mounting the rail guide on the machine.
- With paired profile rail guides of P5 tolerance, only low values of preload should be used, depending on the rail length (fig 1).

Table 1 System accuracy

Units: μm

| Dimension \ Class | | P001 | P01 | P1 | P3 | P5 |
|-------------------|-----------------------|---------|----------|----------|----------|-----------|
| Height H | Dimensional variation | ± 5 | ± 10 | ± 20 | ± 40 | ± 80 |
| | between paired rails | 3 | 5 | 7 | 15 | 25 |
| Width N | Dimensional variation | ± 8 | ± 15 | ± 25 | ± 50 | ± 100 |
| | between paired rails | 3 | 7 | 10 | 20 | 30 |

1

Parallelism

The running accuracy is defined as the variation in the dimensions H and N over the length of the rail (Fig 1, Table 2).

Table 2 Parallelism

Unit: μm

| Grades | | Parallelism of plane C to datum plane A | | | | |
|------------------------|-------|---|-----|-----|----|----|
| Rail track length (mm) | | Parallelism of plane D to datum plane B | | | | |
| over | up to | P001 | P01 | P1 | P3 | P5 |
| – | 315 | 1,5 | 2 | 2,5 | 8 | 16 |
| 315 | 400 | 2 | 2,5 | 3,5 | 10 | 20 |
| 400 | 500 | 2 | 3 | 4,5 | 11 | 24 |
| 500 | 630 | 2 | 3,5 | 6 | 14 | 27 |
| 630 | 800 | 2,5 | 4 | 8 | 16 | 32 |
| 800 | 1000 | 3 | 4,5 | 9 | 19 | 38 |
| 1000 | 1250 | 3 | 6 | 11 | 22 | 43 |
| 1250 | 1600 | 4 | 7 | 14 | 25 | 50 |
| 1600 | 2000 | 4,5 | 8 | 16 | 29 | 57 |
| 2000 | 2500 | 6 | 9 | 18 | 30 | 60 |
| 2500 | 3000 | 6 | 10 | 18 | 30 | 60 |

Accuracy recommendations

The tolerance class should be selected according to the required positioning accuracy of the machine itself. Typical accuracies for various applications are shown in table 3.

Table 3 Accuracy recommendations

Mounting accuracy

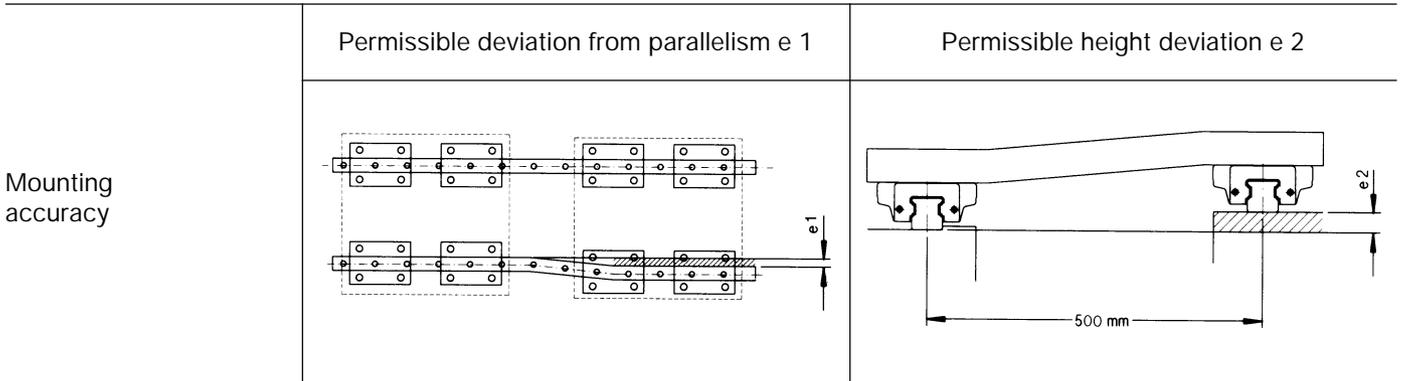

For the smooth running and long operational life of profile rail guides, the quality of the installation and of the mounting surfaces is of great

importance. The following tables show the tolerances for parallelism of the rails.

Unit: μm

| Mounting accuracy | Permissible deviation from parallelism e 1 | | | | Permissible height deviation e2 | | | |
|-------------------|---|----|----|----|--|-----------|-----------|-----------|
| |  | | | |  | | | |

| | | | | | | | | |

Preload and stiffness

For trouble-free operation under different and widely varying operational conditions, it is necessary to determine the appropriate preload. In most instances a light or moderate preload is recommended. For certain cases where high impact loads or vibrations occur, a higher preload is advisable. Tables 1 and 2 show the recommended preload classes for profile rail guides of SKF.

In order not to lose the effect of the preload, the magnitude of the load on the bearing should not exceed three times that of the preload.

The higher the preload, the greater the stiffness.

Diagram 1 shows the qualitative effect of preload on the relationship between load and deformation.

It will be seen that a preloaded system can have a stiffness 2,8 times

greater than that of a non-preloaded system, i.e. the elastic deformation can be reduced by at least one half.

In selecting a profile rail guide, it is of importance to know the exact preload value (see Linear Guidance Systems Handbook for calculation of operational life). Table 2 shows the preload values for each class.

Table 1

| Type of preload | Conditions of use | Application |
|-----------------|---|---|
| Heavy preload | T 3 T 2 Heavy cutting or forming work with heavy impact and vibration. Alternating load. | Machining centres Milling machines Vertical axes of machine tools |
| Medium preload | T 1 Medium cutting or forming work with medium impact and vibration. Light overhung load or alternate load applied. | Surface grinding machines. Robots. Laser Processing machines. Light-duty drilling machines. High speed punching machines. |
| Light preload | T 0 Precise movement with only light vibration and no alternating load. | Precision positioning tables. Tables for optical measuring equipment. Automatic tool changer for machining centres. Welding machines. Handling equipment. |
| Without preload | T Extreme temperature variation; no need for high precision. | Tool changers. Feeding devices. Plasma cutting equipment. |

Designations

Profile rail guides from SKF are manufactured in a variety of types and sizes to suit particular applications.

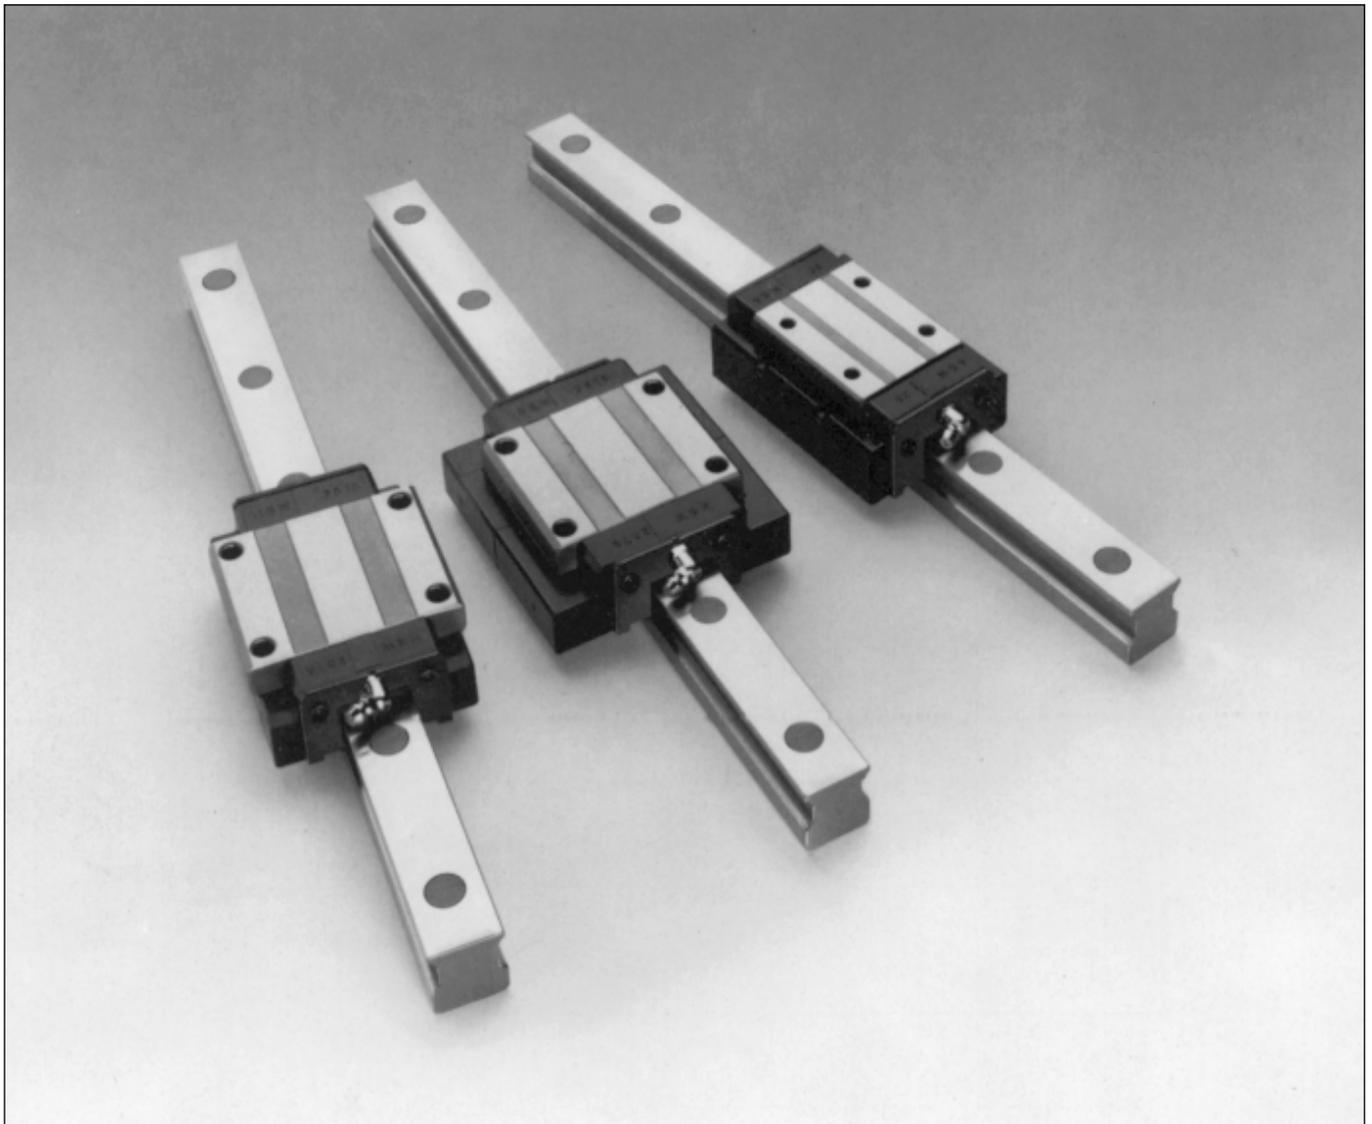

When ordering please specify requirements in accordance with the following chart.

High performance profile rail guides

LLBHS..TA
LLBHS..TB
LLBHS..TR

The special design of the raceway and ball circulation unit of the SKF High Performance range of profile rail guides results in an optimised combination of high load carrying capacity, low friction and exceptionally quiet running at high speeds.

The use of four raceways set at 90° to each other results in a rigid system with equal load carrying capacity in all directions.

The exceptionally large radius of the ball recirculation path enables the achievement of high operational speeds at a particularly low noise level (see fig 2).

In contrast to other systems, profile rail guides from SKF use the principle of two-point contact which reduces differential slip or spin to a minimum. Even where there is high preload there is only a slight increase in friction (fig 1).

Standard length

The rails high performance profile rail guides are produced in different maximum length (see Table 1).

Longer lengths can be achieved by putting together separate pieces.

Table 1
Maximum rail length

| Size | Max. length (mm) |
|----------|------------------|
| LLBHR 15 | 1500 |
| LLBHR 20 | 3000 |
| LLBHR 25 | 3000 |
| LLBHR 30 | 3000 |
| LLBHR 35 | 3000 |
| LLBHR 45 | 3000 |
| LLBHR 55 | 3000 |
| LLBHR 65 | 3000 |

Rails are generally manufactured with a symmetrical hole pattern. Where this is not possible, dimension E is defined as the distance between the end of the rail and the center of the last mounting hole.

Heavy duty profile rail guides

LLBHS..A
LLBHS..B
LLBHS..R
LLBHS..LA
LLBHS..LB
LLBHS..LR

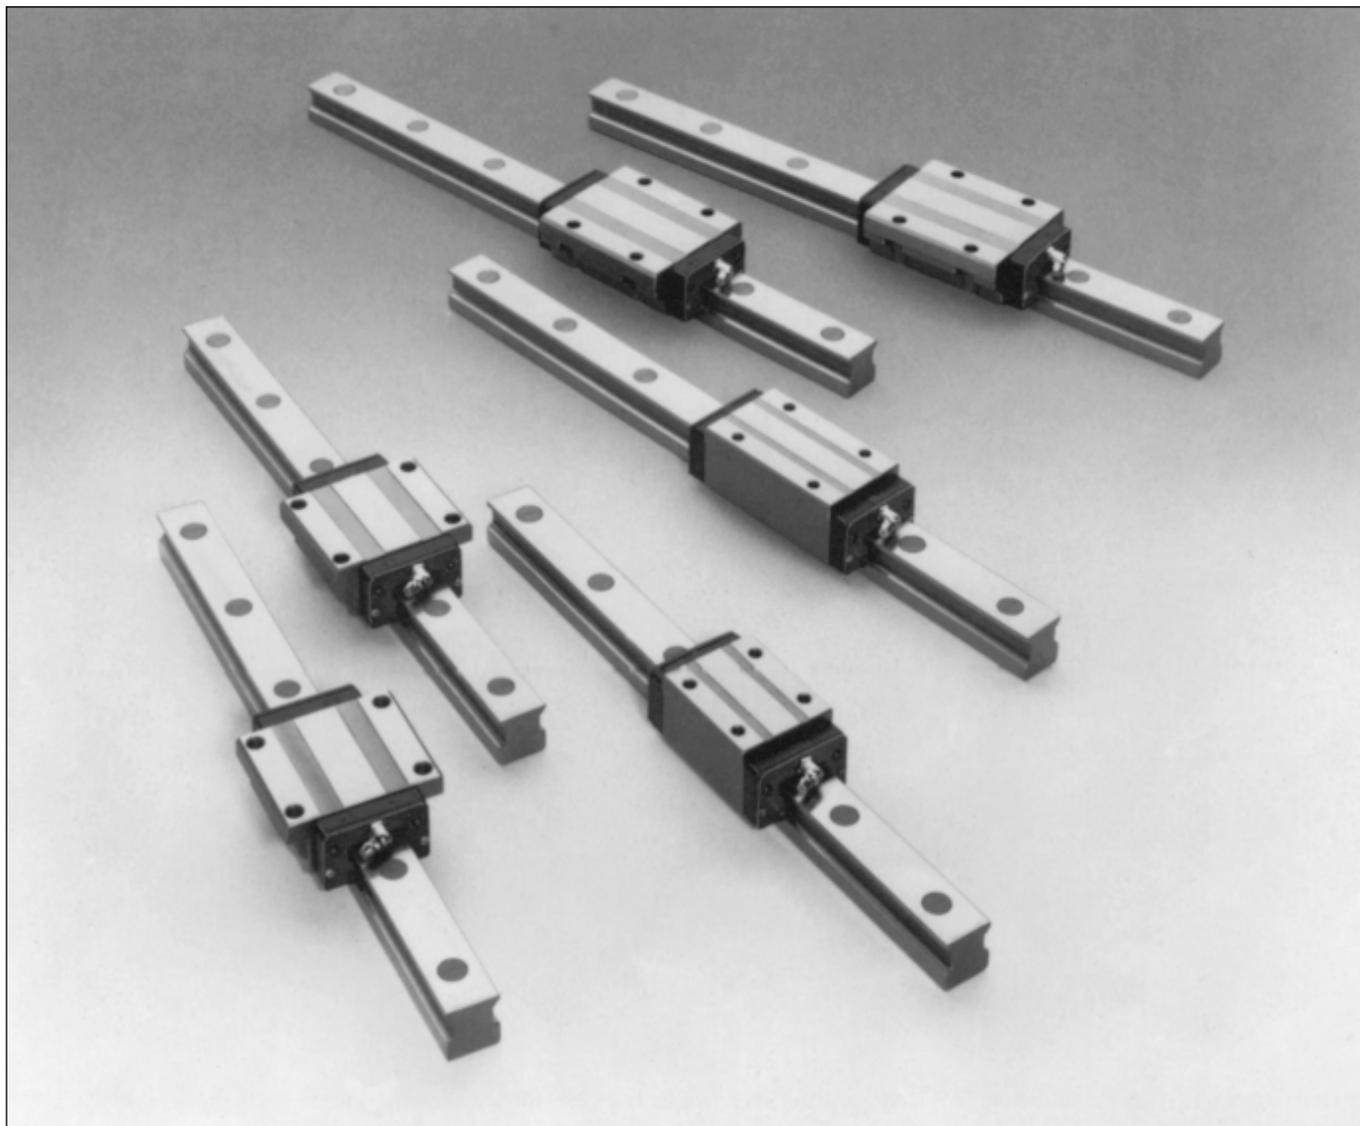

All four raceways are incorporated into the base unit. The ball return caps consist of particularly robust elements made of a tough plastic material which ensures quiet running even at high speeds.

All products in the heavy duty range are characterised by their especially compact and robust design without sacrificing any of the particular advantages of profile rail guides.

The use of hardened steel ensures good rigidity and insensitivity to rough treatment.

Lubrication

Each slide unit is provided with a grease nipple on the front face. This provides simultaneous lubrication to all four ball return paths. To special order, the grease nipple can be positioned elsewhere.

Compensation for mounting errors

The design of the high load series enables compensation for large mounting errors without undue increase in friction.

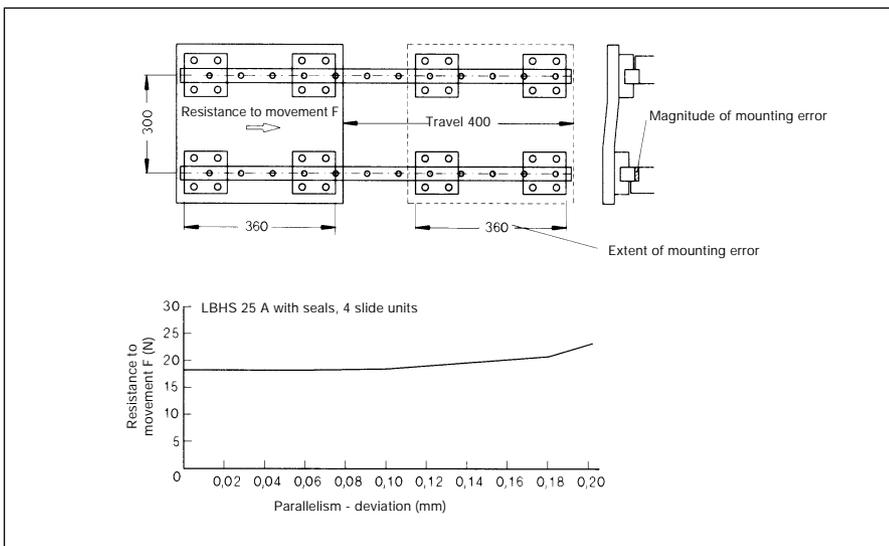

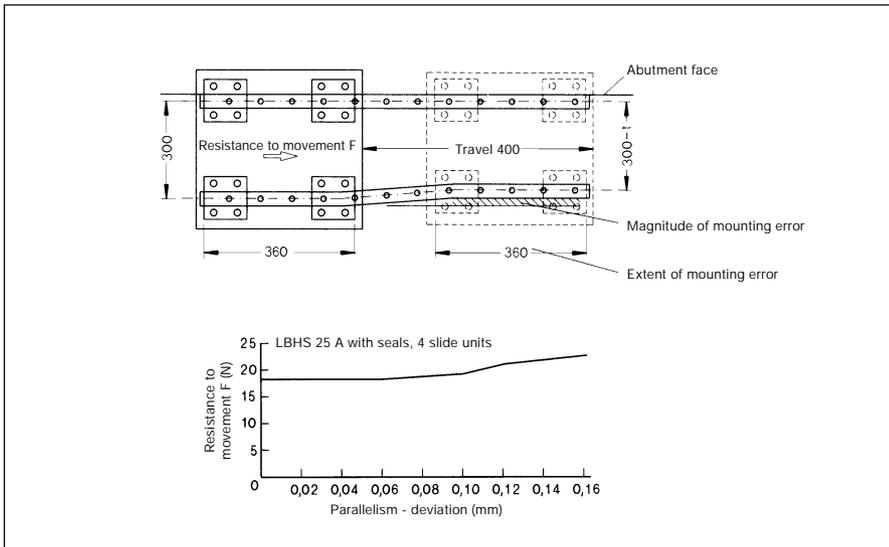

Standard length

The rails for heavy duty profile rail guides are produced in different maximum length (see Table 1). Longer lengths can be achieved by putting together separate pieces.

Rails are generally manufactured with a symmetrical hole pattern. Where this is not possible, dimension E is defined as the distance between the end of the rail and the center of the last mounting hole.

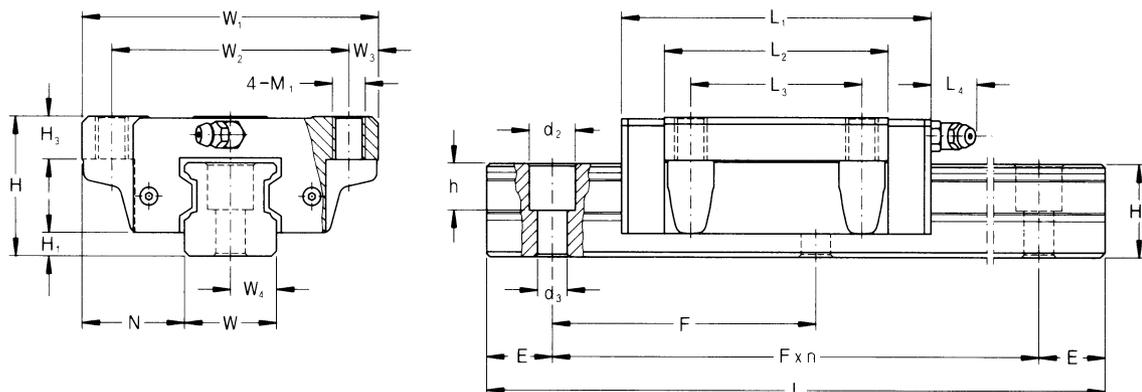

Maximum rail length

| Size | Max. length mm |

*) All SKF load ratings are based on a cumulative travel of 100.000 m in accordance with DIN 636, Part 2. The dynamic load rating must be multiplied by 1,26 for comparison with figures based on 50.000 m cumulative travel.

Bellows

LLBHB..

Where extra protection of a profile rail guide is required, SKF recommends the use of bellows, made of polyester coated on both sides with polyurethane.

- Bellows protect the guidance system against the ingress of dirt which not only increases friction but also shortens the life of the system.
- Bellows protect the operator from accidental injury.

Material:

polyester fabric coated on both sides with polyurethane.

Material thickness: 0,22 or 0,4 mm

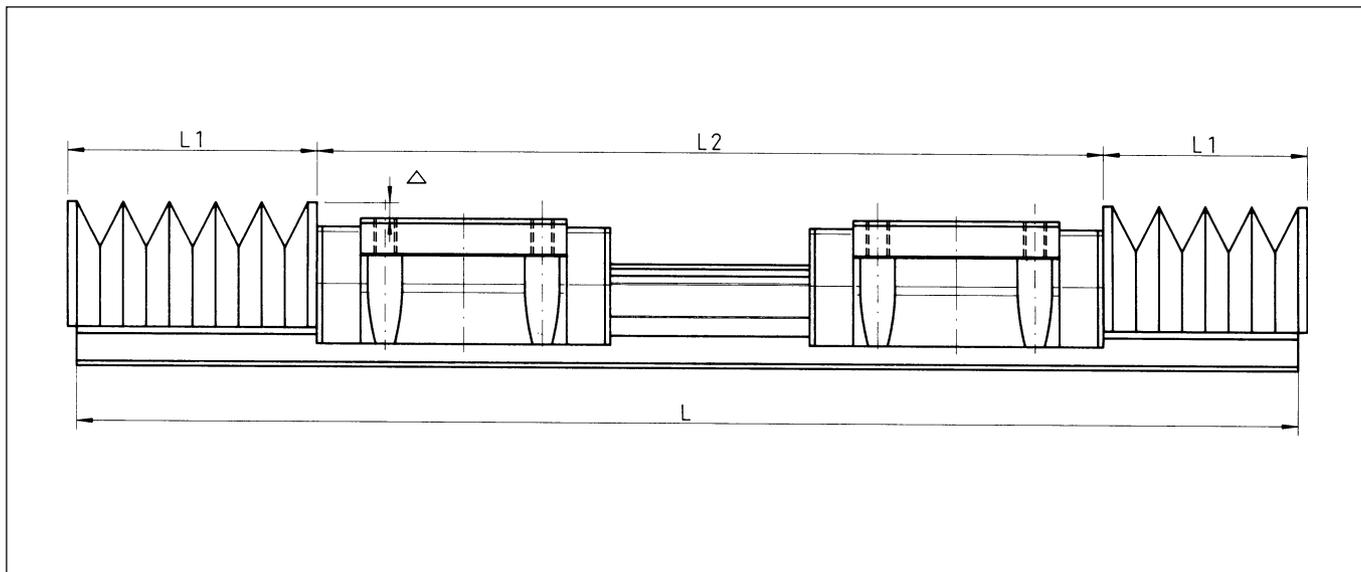

Standard colour: black

Recommended operating temperature: -30° to + 110°C

Resistance: Good resistance to oil and coolants

Special designs:

SKF bellows are based on a plastic frame which can be combined with various other materials. At relatively short notice, special bellows can be supplied to withstand specific extreme environmental conditions (dirt, temperature, radiation, acids, alkalis, etc.)

Calculation:

For a given stroke and L_1 :

$$L_{\min} = \frac{S}{X - 1}$$

$$L_{\max} = S + L_{\min}$$

$$L = L_{\max} + L_{\min} + L_2$$

Number of folds:

$$n = \frac{L_{\max}}{Y} + 1$$

For given L and L_1 :

$$L_{\min} = \frac{L - L_2}{X + 1}$$

$$L_{\max} = L_{\min} \times X$$

$$S = L_{\max} - L_{\min}$$

Number of folds:

$$n = \frac{L_{\max}}{Y} + 1$$

| Bellows designation | Factors | | Δ | L_{\min}/fold |
|---------------------|---------|-----------------------------|----------|------------------------|
| | X | Y L_{\max}/fold | | |
| LLBHB 15 | 9,64 | 21,2 | 9 | 2,2 |

Compact and Medium load profile rail guides

LLBUS..R
LLBUS..SR
LLBNS..TR

To complete the range of profile rail guides SKF also offers various additional series which differ mainly in their external dimensions.

LLBUS..R and LLBUS..SR

These compact series are characterised by the optimisation of the concept of profile rail guides. The assembled cross section is reduced when compared with the standard range. The LLBUS..SR range has a shorter slide unit which can be an advantage where there is no call for high load carrying capacity. On each

of these series, the slide unit can only be attached from above. They are only supplied as 'end cap type' units.

LLBNS—TR

Profile rail guides of this type have a greater height and lower load rating than the other ranges. The slide units, of the "tube type" with external ball return paths, are suitable for high speed operation and are also for attachment from above.

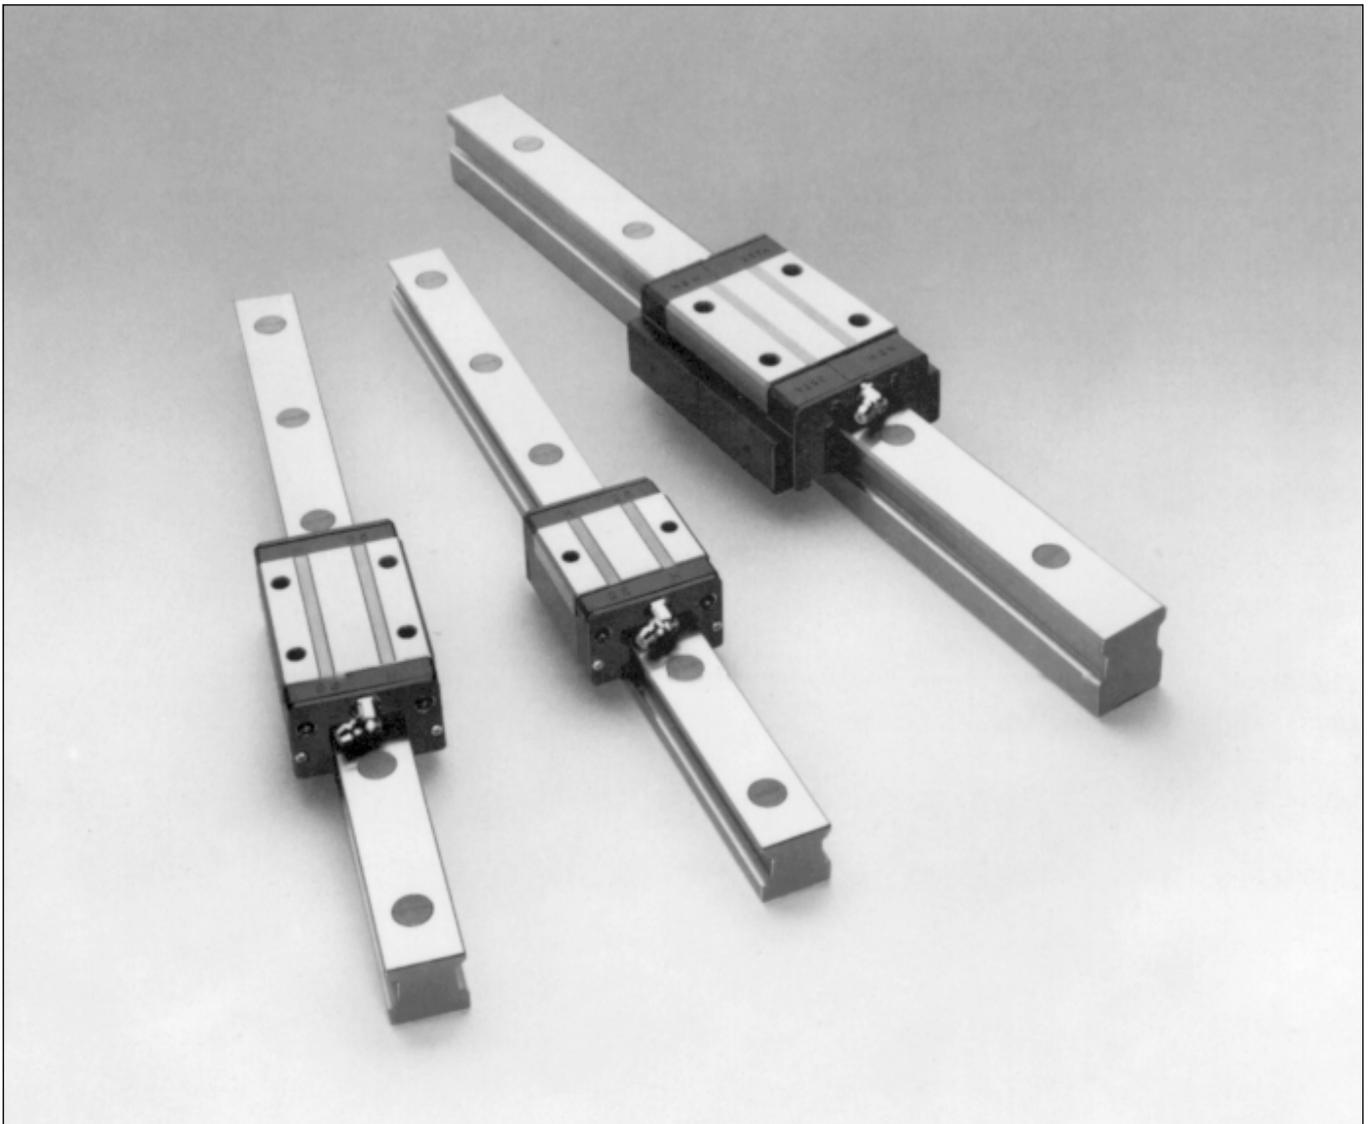

Standard length

The rails for high performance profile rail guides are produced in different maximum length (see Table 1). Longer lengths can be achieved by putting together separate pieces.

Rails are generally manufactured with a symmetrical hole pattern. Where this is not possible, dimension

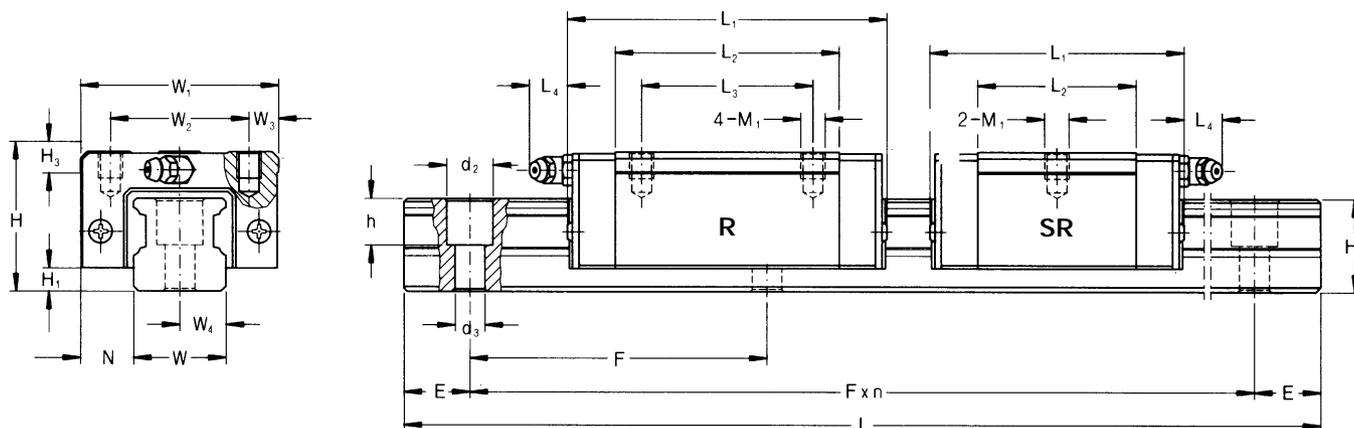

| Maximum rail length Size | | Max. length (mm) |
|--------------------------|----------|------------------|
| LLBUR 15 | LLBNR 15 | 1500 |
| LLBUR 20 | LLBNR 20 | 3000 |
| LLBUR 25 | LLBNR 25 | 3000 |
| LLBUR 30 | LLBNR 30 | 3000 |
| LLBUR 35 | - | 3000 |
| - | LLBNR 40 | 3000 |
| LLBUR 45 | - | 3000 |
| - | LLBNR 50 | 3000 |
| LLBUR 55 | - | 3000 |

E is defined as the distance between the end of the rail and the center of the last mounting hole.

M-Type profile rail guides

LLBMS..TW
LLBMS..TC

M-Type profile rail guides from SKF are basic linear guidance systems for unlimited travel, with two ball recirculation paths in the slide unit. They can be used together with either an asymmetric rail having two raceways or with H-section 4-raceway units.

These offer the following benefits:

- Low assembly profile
- Simplicity of mounting
- Equal load carrying capacity in all load directions
- Quiet running at high speed
- High load carrying capacity

Low assembly profile

In comparison with the other designs of rail guide, M-Type profile rail guides enable the construction of particularly low-profile systems. Combinations can also be made with the 'H-type' rails (fig 2).

Simplicity of mounting

Since the balls are safely retained in the slide carrier, mounting is fast and simple. Two alternative models are available, depending on the type of mounting.

Equal load carrying capacity in all load directions

With two slide units mounted in

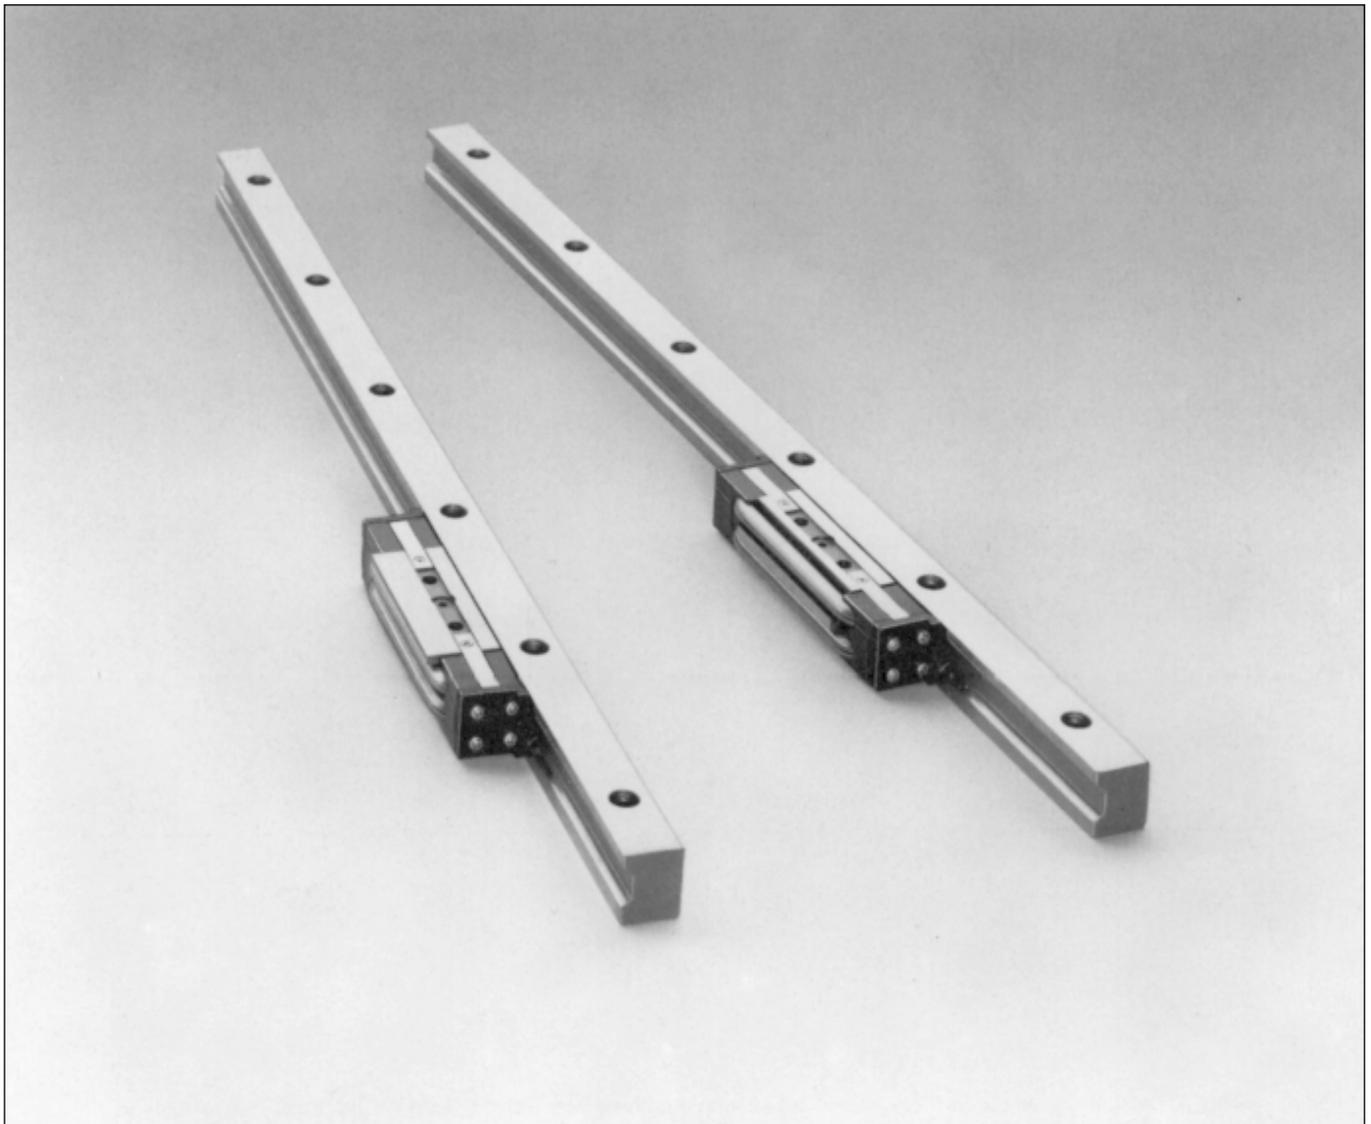

parallel, the guidance system can accommodate loads from any direction.

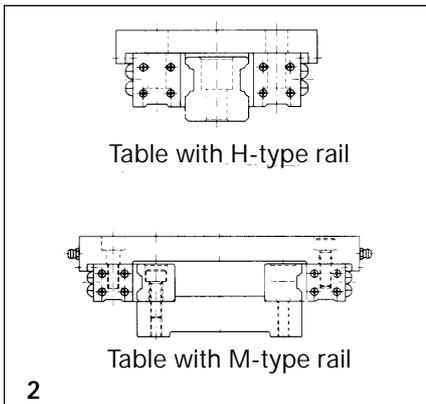

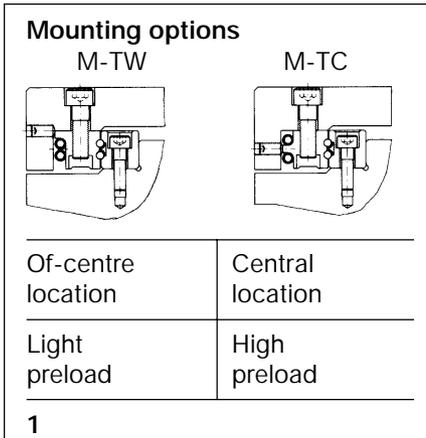

Quiet running at high speed

The external ball return paths with their extra large radius of curvature ensure quiet running even at high speed.

High load carrying capacity

The use of steel balls of relatively large diameter ensures the high stiffness and load carrying capacity of M-Type profile rail guides from SKF.

Accuracy classes

M-Type profile rail guides from SKF are available in five tolerance classes. (see tables 2 and 3).

Height "H"

The tolerance of the height "H" is significant when at least two rails with slid units are to be mounted on the same base. This avoids undue misalignment of the mating surfaces.

Width "N"

The dimension "N" is of particular significance in the case of a rail with several slide units.

Table 1

Maximum rail length

| Size | Max. length (mm) |
|----------|------------------|
| LLBMR 10 | 500 |
| LLBMR 15 | 1500 |
| LLBMR 25 | 1500 |
| LLBMR 35 | 3000 |
| LLBMR 40 | 3000 |
| LLBMR 45 | 3000 |
| LLBMR 55 | 3000 |
| LLBMR 65 | 3000 |

Standard lengths

Rails for M-Type profile rail guides are available in various lengths (see Table 1).

Longer lengths can be achieved by putting together separate pieces. Special long rails can be made to order.

Preload and stiffness

Preload is adjusted through the use of set screws on the side of the unit. By measuring the required resistance to movement of the mounted and adjusted slide unit, the preload can be calculated relatively accurately according to the following formula:

$$P = F/0,004$$

P = Preload in Newtons (N)

F = Resistance to movement in Newtons (N)

Table 2 System accuracy

Units: μm

*) All SKF load ratings are based on a cumulative travel of 100.000 m in accordance with DIN636, Part 2. The dynamic load rating must be multiplied by 1,26 for comparison with figures based on 50.000 km cumulative travel.

Miniature profile rail guides

LLBKS..TR

Miniature profile rail guides from SKF are for use in high precision applications. Their advanced design offers the following benefits:

- simplicity of mounting
- equal load carrying capacity in all load directions
- optimised ball recirculation
- simplicity of design

Simplicity of mounting

The ribbed underside of the rail enables simple mounting in a suitably machined groove.

Equal load carrying capacity in all load directions

The steel balls circulate in four paths between the rail and slid unit. The square configuration of the raceways results in a guidance system with good rigidity, thus providing a high dynamic load rating in all four load directions.

Optimised ball recirculation

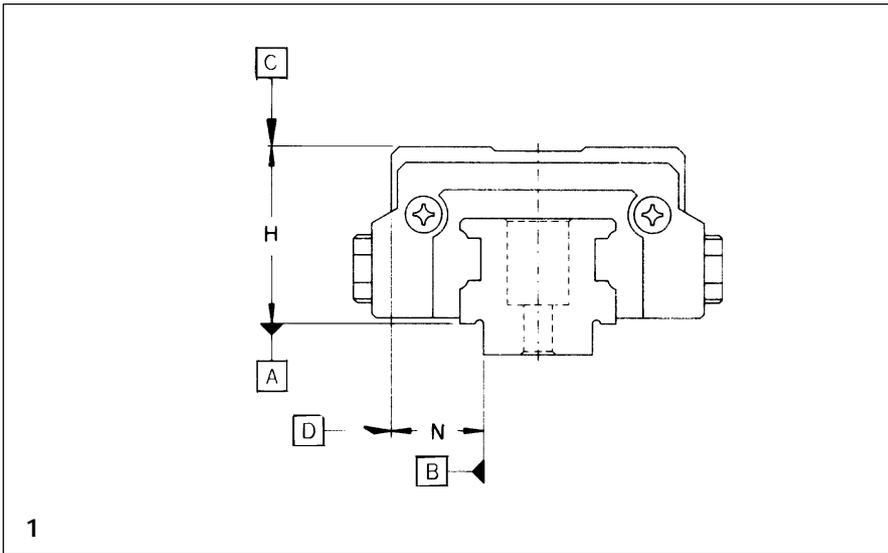

An external ball return path enables the use of an extra large radius, ensuring quiet running even at higher speeds. The use of an external return path also avoids unnecessary

weakening of the slid unit and therefore allows greater stiffness of the system.

Simplicity of design

Although the design is relatively simple, with one-piece ball return paths, the balls are safely retained in the slide unit, thus allowing easy mounting.

Accuracy

Miniature profile rail guides from SKF are manufactured in three accuracy classes, as shown in Tables 1 and 2.

Preload and stiffness

Miniature profile rail guides from SKF are available in two different preload classes. Preloaded guides have approximately twice the stiffness of those without preload. Table 3 shows the values of preload for the various sizes of rail guide.

Table 1 System accuracy

Units: μm

| Dimensions | | Class | P1 | P3 | P5 |
|------------|--------------------------------|-------|----------|----------|----------|
| Height H | Dimensional tolerance | | ± 10 | ± 20 | ± 40 |
| | Deviation between paired rails | | 5 | 20 | 40 |
| Width N | Dimensional tolerance | | ± 10 | ± 30 | ± 50 |
| | Deviation between paired rails | | 10 | 30 | 40 |

Table 3

Preload

Units: N

| Preload class | Size | No Pre-load | Light Pre-load |
|---------------|-------------|-------------|----------------|
| | | T0 | T1 |
| | LLBKS 7 TR | 0 | 50 |
| | LLBKS 9 TR | 0 | 50 |
| | LLBKS 12 TR | 0 | 100 |

Table 2 Parallelism

Units: μm

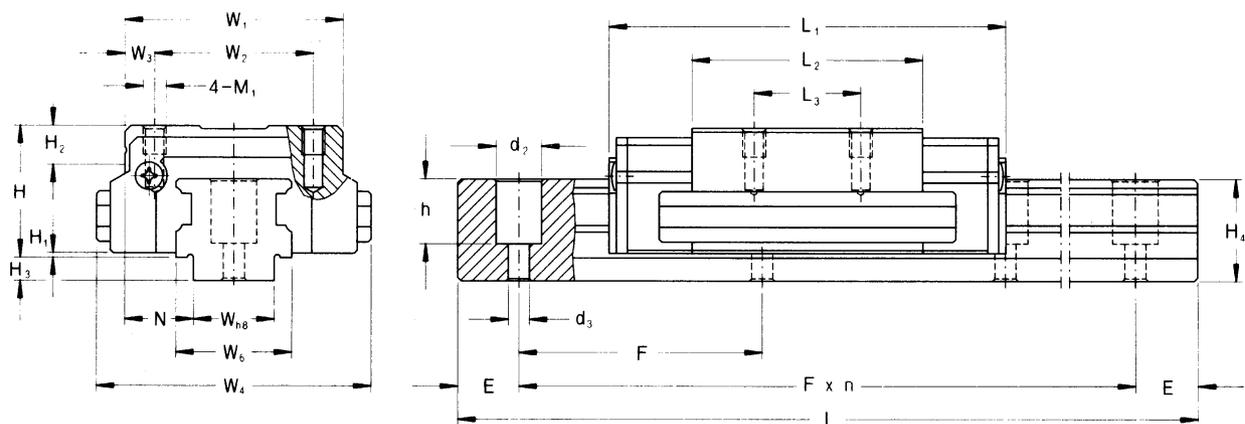

| Rail track length (mm) | | Parallelism of plane C to datum plane A Parallelism of plane D to datum plane B | | |
|------------------------|-------|--|----|----|
| over | up to | P1 | P3 | P5 |
| – | 120 | 1,5 | 4 | 10 |
| 120 | 180 | 1,5 | 5 | 12 |
| 180 | 250 | 2 | 6 | 14 |
| 250 | 315 | 2,5 | 8 | 17 |
| 315 | 400 | 3,5 | 10 | 20 |
| 400 | 500 | 4,5 | 11 | 24 |
| 500 | 630 | 6 | 14 | 27 |

Standard lengths

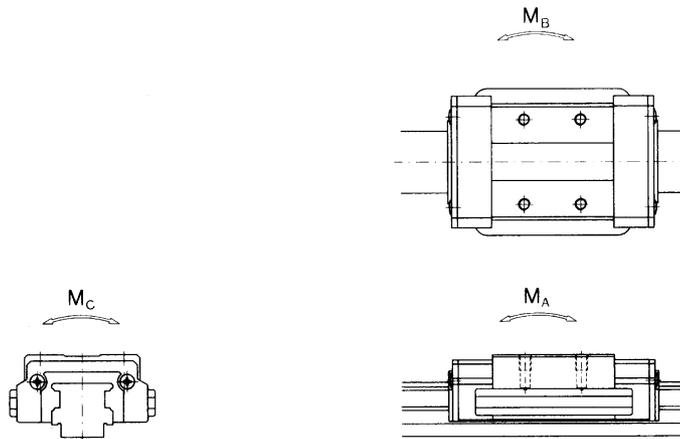

The maximum standard length for miniature profile rail guides is 500 mm. For longer runs, separate lengths can easily be joined together.

SKF Linear Motion offers a wide range of precision engineered linear motion components, units and systems. In addition to comprehensive product literature and software, SKF offers assistance from experienced linear motion engineers.

Linear Motion has **3 product lines** and a sales organisation based on **10 specialized sales companies** located in Europe and in the USA.

However the product availability as well as the product application is **world-wide granted by the SKF Bearing international network**. To get any other SKF address all over the world, please contact one of the companies below.
